

This is still a work  
in progress I will  
Update it each week

# Chapter 1: Network Types, Topologies, and Characteristics

# Network topologies

**Physical topology** diagrams illustrate the physical location of intermediary devices and cable installation.

**Logical topology** diagrams illustrate devices, ports, and the addressing scheme of the network.

**STAR**

**RING**

**BUS**

**MESH**

A ***bus topology*** is a physical topology where network nodes are connected to a single cable or bus.

## ***bus topology***

# *ring topology*

---

- A **ring topology** is a physical topology where each node is connected to exactly two other nodes, resembling a ring.

# ***star topology***

- A **star topology** is a physical topology where each node is connected to a central node, resembling a star or a hub with spokes.

# *mesh topology*

- A ***mesh topology*** is a physical topology where each node is connected to every other node in a network.

A ***hybrid topology*** is a physical topology where at least two different physical topologies are combined.

# DO MANY WORDS!!!!

---

A circuit-switched network uses preconfigured links from source to destination. A circuit-switched network's physical and logical topologies reflect each other.

A PSN breaks down data into smaller packets for faster transmission. A PSN's logical topology can vary from transmission to transmission.

A network's control plane relies on various communication standards, or protocols, to determine how data is transmitted.

A network's data plane carries the data from source to destination. The data plane relies on information provided by the control plane, such as routes and addresses.

A network's management plane manages and monitors the nodes used in the control and data planes. The management plane oversees the control plane.

# Network mediums

# Clients, Server, and Peers

|     |                            |
|-----|----------------------------|
| PAN | PERSONAL AREA              |
| LAN | Local Area Network         |
| CAN | Campus Area Network        |
| MAN | Metropolotain Area Network |
| WAN | Wide Area Network          |

# Service provider links

***DEMARCATATION POINT***  
is the location where a service provider's equipment connects to a customer's on-premise equipment.

| Connection | Description                                                                        |
|------------|------------------------------------------------------------------------------------|
|            | high bandwidth, always on, internet offered by cable television service providers. |
|            | high bandwidth, always on, internet connection that runs over a telephone line.    |
|            | uses a cell phone network to connect to the internet.                              |
|            | major benefit to rural areas without Internet Service Providers.                   |
| telephone  | inexpensive, low bandwidth option using a modem.                                   |

# Chapter 1: Network Types, Topologies, and Characteristics

# Chapter 2: Conceptual Models and Network Devices

## 2.1 Conceptual Models

# Conceptual model structure

- ***Open Systems Interconnection (OSI) model*** is a seven-layer network conceptual model created by the International Organization for Standardization (ISO).
- ***Department of Defense (DoD) model*** is a four-layer network conceptual model implemented as the internet protocols suite. The DoD model is commonly known as the ***TCP/IP model***.

# Reference Models

## The Benefits of Using a Layered Model

| OSI Model    | TCP/IP Protocol Suite      | TCP/IP Model   |
|--------------|----------------------------|----------------|
| Application  | HTTP, DNS, DHCP, FTP       | Application    |
| Presentation |                            |                |
| Session      |                            |                |
| Transport    | TCP, UDP                   | Transport      |
| Network      | IPv4, IPv6, ICMPv4, ICMPv6 | Internet       |
| Data Link    | Ethernet, WLAN, SONET, SDH | Network Access |
| Physical     |                            |                |

## Reference Models

### The OSI Reference Model

| OSI Model Layer         | Description                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------|
| <b>7 - Application</b>  | Contains protocols used for process-to-process communications.                                 |
| <b>6 - Presentation</b> | Provides for common representation of the data transferred between application layer services. |
| <b>5 - Session</b>      | Provides services to the presentation layer and to manage data exchange.                       |
| <b>4 - Transport</b>    | Defines services to segment, transfer, and reassemble the data for individual communications.  |
| <b>3 - Network</b>      | Provides services to exchange the individual pieces of data over the network.                  |
| <b>2 - Data Link</b>    | Describes methods for exchanging data frames over a common media.                              |
| <b>1 - Physical</b>     | Describes the means to activate, maintain, and de-activate physical connections.               |

## 2.2 OSI Model Layer

# Reference Models

## The OSI Reference Model

| OSI Model Layer         | Description                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------|
| <b>7 - Application</b>  | Contains protocols used for process-to-process communications.                                 |
| <b>6 - Presentation</b> | Provides for common representation of the data transferred between application layer services. |
| <b>5 - Session</b>      | Provides services to the presentation layer and to manage data exchange.                       |
| <b>4 - Transport</b>    | Defines services to segment, transfer, and reassemble the data for individual communications.  |
| <b>3 - Network</b>      | Provides services to exchange the individual pieces of data over the network.                  |
| <b>2 - Data Link</b>    | Describes methods for exchanging data frames over a common media.                              |
| <b>1 - Physical</b>     | Describes the means to activate, maintain, and de-activate physical connections.               |

A networking model is only a representation of a network operation. The model is not the actual network.

OSI Model

TCP/IP Protocol Suite

|              |                            |
|--------------|----------------------------|
| Application  | HTTP, DNS, DHCP, FTP       |
| Presentation |                            |
| Session      |                            |
| Transport    | TCP, UDP                   |
| Network      | IPv4, IPv6, ICMPv4, ICMPv6 |
| Data Link    | Ethernet, WLAN, SONET, SDH |
| Physical     |                            |

**Layer 7** is the OSI model application layer, where a network protocol interacts with a network-aware application.

A networking model is only a representation of a network operation. The model is not the actual network.

OSI Model

TCP/IP Protocol Suite

TCP/IP Model

|              |                            |  |
|--------------|----------------------------|--|
| Application  | HTTP, DNS, DHCP, FTP       |  |
| Presentation |                            |  |
| Session      |                            |  |
| Transport    | TCP, UDP                   |  |
| Network      | IPv4, IPv6, ICMPv4, ICMPv6 |  |
| Data Link    | Ethernet, WLAN, SONET, SDH |  |
| Physical     |                            |  |

**Layer 6** is the OSI model presentation layer, where data is prepared for transmission between the application layer and session layer.

OSI Model

A networking model is only a representation of a network operation. The model is not the actual network.

TCP/IP Protocol Suite

TCP/IP Model

|              |                            |
|--------------|----------------------------|
| Application  | HTTP, DNS, DHCP, FTP       |
| Presentation |                            |
| Session      |                            |
| Transport    | TCP, UDP                   |
| Network      | IPv4, IPv6, ICMPv4, ICMPv6 |
| Data Link    | Ethernet, WLAN, SONET, SDH |
| Physical     |                            |

**Layer 5** is the OSI model session layer, where a data transmission channel known as a **session** is established between communicating devices.

A networking model is only a representation of a network operation. The model is not the actual network.

OSI Model

TCP/IP Protocol Suite

|              |                            |
|--------------|----------------------------|
| Application  | HTTP, DNS, DHCP, FTP       |
| Presentation |                            |
| Session      |                            |
| Transport    | TCP, UDP                   |
| Network      | IPv4, IPv6, ICMPv4, ICMPv6 |
| Data Link    | Ethernet, WLAN, SONET, SDH |
| Physical     |                            |

**Layer 4** is the OSI model transport layer, where data from the upper-level layers is divided into smaller-sized blocks of data for faster transmission. Two network protocols are referenced by Layer 4:

- **Transmission control protocol (TCP)** is a network protocol used to establish a guaranteed, connection-oriented communication channel between communicating devices.
- **User datagram protocol (UDP)** is a network protocol used to provide non-guaranteed, connectionless data transport for communicating devices.

**Layer 3** is the OSI model network layer, where data receives logical address information needed to reach the recipient's network.

- **Internet protocol (IP)** is the network protocol used to address data sent over the internet or another network.
- **Packet** is the PDU created by IP, and includes an IP header consisting of logical address information.

A networking model is only a representation of a network operation. The model is not the actual network.

**Layer 2** is the OSI model data link layer, where data is transmitted to the recipient node.

OSI Model

TCP/IP Protocol Suite

|              |                            |
|--------------|----------------------------|
| Application  | HTTP, DNS, DHCP, FTP       |
| Presentation |                            |
| Session      |                            |
| Transport    | TCP, UDP                   |
| Network      | IPv4, IPv6, ICMPv4, ICMPv6 |
| Data Link    | Ethernet, WLAN, SONET, SDH |
| Physical     |                            |

- **Frame** is the PDU created by layer 2 containing data transmission parameters and physical address.

A networking model is only a representation of a network operation. The model is not the actual network.

OSI Model

TCP/IP Protocol Suite

|              |                            |
|--------------|----------------------------|
| Application  | HTTP, DNS, DHCP, FTP       |
| Presentation |                            |
| Session      |                            |
| Transport    | TCP, UDP                   |
| Network      | IPv4, IPv6, ICMPv4, ICMPv6 |
| Data Link    | Ethernet, WLAN, SONET, SDH |

**Layer 1** is the OSI model physical layer, where a payload is transmitted across a network medium.

- Bits are the PDU for this layer

## 2.3 TCP/IP Model

A networking model is only a representation of a network operation. The model is not the actual network.

**OSI Model**

**TCP/IP Protocol Suite**

**TCP/IP Model**

|              |                               |                |
|--------------|-------------------------------|----------------|
| Application  | HTTP, DNS, DHCP, FTP          | Application    |
| Presentation |                               |                |
| Session      |                               |                |
| Transport    | TCP, UDP                      | Transport      |
| Network      | IPv4, IPv6,<br>ICMPv4, ICMPv6 | Internet       |
| Data Link    | Ethernet, WLAN, SONET, SDH    | Network Access |
| Physical     |                               |                |

| Network      | IPv4, IPv6,<br>ICMPv4, ICMPv6 | Internet       |
| Data Link    | Ethernet, WLAN, SONET, SDH    | Network Access |
| Physical     |                               |                |

# Physical Layer Standards

Application

Presentation

Session

Transport

Network

Data Link

Physical

The TCP/IP standards are implemented in software and governed by the IETF.

The physical layer standards are implemented in hardware and are governed by many organizations including:

- ISO
- EIA/TIA
- ITU-T
- ANSI
- IEEE

# Encoding

- Encoding converts the stream of bits into a format recognizable by the next device in the network path.
- This 'coding' provides predictable patterns that can be recognized by the next device.
- Examples of encoding methods include Manchester (shown in the figure), 4B/5B, and 8B/10B.

# Signaling

- The signaling method is how the bit values, “1” and “0” are represented on the physical medium.
- The method of signaling will vary based on the type of medium being used.

Electrical Signals Over Copper Cable

Light Pulses Over Fiber-Optic Cable

Apply a display filter ... <=>

# 3.1 Bounded Media

---

# Physical Media Characteristics

**Cost**

**Speed**

**Distance**

Speed is determined by measuring bandwidth and throughput

- **Bandwidth** is the maximum amount of data a connection can transmit in a given amount of time.
- **Throughput** is the actual amount of data a connection can transmit in a given amount of time.

## Physical Layer Characteristics

# Bandwidth

- Bandwidth is the capacity at which a medium can carry data.
- Digital bandwidth measures the amount of data that can flow from one place to another in a given amount of time; how many bits can be transmitted in a second.
- Physical media properties, current technologies, and the laws of physics play a role in determining available bandwidth.

| Unit of Bandwidth   | Abbreviation | Equivalence                                    |
|---------------------|--------------|------------------------------------------------|
| Bits per second     | bps          | 1 bps = fundamental unit of bandwidth          |
| Kilobits per second | Kbps         | 1 Kbps = 1,000 bps = $10^3$ bps                |
| Megabits per second | Mbps         | 1 Mbps = 1,000,000 bps = $10^6$ bps            |
| Gigabits per second | Gbps         | 1 Gbps = 1,000,000,000 bps = $10^9$ bps        |
| Terabits per second | Tbps         | 1 Tbps = 1,000,000,000,000 bps = $10^{12}$ bps |

## About this item

- A Trusted Name in Home Connectivity: Better connectivity, better speed. The ARRIS SURFboard SB8200 DOCSIS 3.1 Cable Modem is designed to bring you superior connectivity, increase your network capability and provide faster streaming and downloading throughout your home. From a trusted brand with over 260 million modems sold and growing. .Telephone Port : None. HD Media Streaming : Yes

# Broadband

It uses more than one frequency

# Coaxial Cable

- Consists of the following:
  - Outer cable jacket to prevent minor physical damage
  - A woven copper braid, or metallic foil, acts as the second wire in the circuit and as a shield for the inner conductor.
  - A layer of flexible plastic insulation
  - A copper conductor is used to transmit the electronic signals.

# Twinax

- Direct Access Cable
- Short range
- High speed
- 10 Gbps, 40 Gbps, and 100 Gbps.

Small Formfactor Pluggable (SFP)

## 3.3 Twisted Pair Media

# Unshielded Twisted Pair

Standards for UTP are established by the TIA/EIA. TIA/EIA-568 standardizes elements like:

- Cable Types
- Cable Lengths
- Connectors
- Cable Termination
- Testing Methods

Category 3 Cable (UTP)

Category 5 and 5e Cable (UTP)

Category 6 Cable (UTP)

# UTP Cabling Standards and Connectors

RJ-45 Connector

Poorly terminated UTP cable

RJ-45 Socket

Properly terminated UTP cable

# Shielded Twisted Pair

# T-568B

# Cabling Naming Convention

Transmission speed = 100 Mbps

Physical medium = TP

100BASE-TX

Communication type = baseband

# Decoding the naming Convention

## Transmission Speed

10 – 10 Mbps

100 – 100Mbps

1000 – 1Gbps

10000 – 10 Gbps

40,000,0000 – 40Gbps

Baseband  
Broadband

**TX** – Twisted Pair (Cat 5/5e/6, etc.)

**T** – Twisted Pair (general)

**FX** – Fiber Optic, Multimode (100 Mbps, ~2 km)

**SX** – Short-Range Multimode Fiber (~550 m)

**LX** – Long-Range **Single-Mode** Fiber (~10 km)

**SR** – Short-Range Multimode Fiber (10G, ~300–400 m)

**LR** – Long-Range Single-Mode Fiber

(10 km typical for 10GBASE-LR)

# 10BASE-T

## Transmission Speed

**SX** – Short-Range Multimode Fiber (~550 m)

**LX** – Long-Range **Single-Mode** Fiber (~10 km)

**SR** – Short-Range Multimode Fiber (10G, ~300–400 m)

**LR** – Long-Range Single-Mode Fiber

(10 km typical for 10GBASE-LR)

- 40 Mbps
- Baseband
- Twisted Pair

# 10BASE-LR

## Transmission Speed

10 – 10 Mbps  
100 – 100Mbps  
1000 – 1Gbps  
10000 – 10 Gbps  
40,000,0000 – 40Gbps

Baseband  
Broadband

**TX** – Twisted Pair (Cat 5/5e/6, etc.)

**T** – Twisted Pair (general)

**FX** – Fiber Optic, Multimode (100 Mbps, ~2 km)

**SX** – Short-Range Multimode Fiber (~550 m)

**LX** – Long-Range **Single-Mode** Fiber (~10 km)

**SR** – Short-Range Multimode Fiber (10G, ~300–400 m)

**LR** – Long-Range Single-Mode Fiber

(10 km typical for 10GBASE-LR)

- 10 Mbps
- Baseband
- Long-Range Single mode Fiber

# 100BASE-TX

## Transmission Speed

10 – 10 Mbps  
100 – 100Mbps  
1000 – 1Gbps  
10000 – 10 Gbps  
40,000,0000 – 40Gbps

Baseband  
Broadband

**TX** – Twisted Pair (Cat 5/5e/6, etc.)

**T** – Twisted Pair (general)

**FX** – Fiber Optic, Multimode (100 Mbps, ~2 km)

**SX** – Short-Range Multimode Fiber (~550 m)

**LX** – Long-Range **Single-Mode** Fiber (~10 km)

**SR** – Short-Range Multimode Fiber (10G, ~300–400 m)

**LR** – Long-Range Single-Mode Fiber

(10 km typical for 10GBASE-LR)

- 100 Mbps
- Baseband
- Twisted Pair

# Fiber Optic Media

# Safety

- Read and follow rules in lab manual
- Wear safety glasses
- Don't look at fibers
- Dispose of fiber scraps carefully
- Work on dark surface to help spot fiber scraps
- Be careful with chemicals
- No eating or drinking in labs

# Most light is Infrared

**Sensitivity of Human Eye**

Fiber Scraps (Most Dangerous)

# Anatomy of fiber optic cable

---

# Two types of fiber cable

---

- Multimode (MM) fiber – large core fiber used for slower premises (indoor) networks
- Singlemode (SM) fiber – small core fiber used for everything else – higher bandwidth and lower attenuation

Multimode

Singlemode

This Photo by Unknown Author is licensed under CC BY

# Singlemode

- Singlemode (SM) fiber – small core fiber used for everything else – higher bandwidth and lower attenuation
- Core size is 8 Microns in diameter

This Photo by Unknown Author is licensed under [CC-BY](#)

# Multimode

- Multimode (MM) fiber – large core fiber used for slower premises (indoor) networks
- Fiber cores are 50- 62.6 microns
- Different Rays or Modes of light are transmitted in multimode fiber

This Photo by Unknown Author is licensed under [CC BY](#)

# Convert Electrical To Optical

Transceivers

Media  
Converters

# Fiber Optic Connectors & Splices

---

- Connectors and splices must have:
  - Low loss
  - Low reflectance
  - Mechanical strength
  - Reliability
  - Ease of use in the field

# Connector Identifier

ST

LC

SC

MPO

## Do You Have To Field Terminate At All?

- Design a prefabricated cabling system that you just install, plug in and test
- May be cost effective in new construction
- Premises components shown

# Bounded Media Management

# Patch Panels

- Numerous Ports
- Usually in the networking or distribution closet
- Uses a punchdown

This Photo by Unknown Author is licensed under [CC BY](#)

structured  
cabling  
pathways

General Cable

LSZH Cable

Plenum Cable

Riser Cable

# Reading OSP Cable Jackets

- Here is an excellent example of why you need to learn to “read” cables. There is a
- lot of useful information there and some is critical for proper installation of the cable.

# Network Cable Making

Station #1

# Mapping Network Drops

Station #2

Using a fluke cable tester

Map cables in classroom to patch pannel

# Working with media converters

Station #3

Build a small network using Cat and fiber cable

Station #4

Using a punch down to create patch panels

# Making Patch Panels

# Chapter 3: Bounded Media Standards and Applications

# Chapter 4: Address Types

Take out a paper and write down the 7-layer OSI model

## 4.1 Types of network addresses

# Encapsulation Process

## TCP/IP Layers

## Port address (Layer 4)

- 16-bit unsigned number that uniquely identifies a network application or service
- 0 and 65,535.
- Port 443 identifies the HTTPS service.

## Port address (Layer 4)

- 16-bit unsigned number that uniquely identifies a network application or service
- 0 and 65,535.
- Port 443 identifies the HTTPS service.

Source Address (ip.src), 4 bytes

# Port Address

- Network connections use **port addresses** to identify services
- IP address → device location; Port address → service/process
- Devices handle multiple services at once (e.g., email, FTP, web)
- Common ports: **20/21 = FTP**, **443 = HTTPS**
- Hackers exploit open ports → close unused ports for security

```

## Service Name and Transport Protocol Port Number Registry

### Last Updated

2025-08-26

### Expert(s)

TCP/UDP: Joe Touch; Eliot Lear, Kumiko Ono, Wes Eddy, Brian Trammell,  
Jana Iyengar, and Michael Scharf  
SCTP: Michael Tuexen  
DCCP: Eddie Kohler and Yoshifumi Nishida

### Reference

[\[RFC6335\]](#)

### Note

Service names and port numbers are used to distinguish between different services that run over transport protocols such as TCP, UDP, DCCP, and SCTP.

Service names are assigned on a first-come, first-served process, as documented in [\[RFC6335\]](#).

Port numbers are assigned in various ways, based on three ranges: System Ports (0-1023), User Ports (1024-49151), and the Dynamic and/or Private Ports (49152-65535); the different uses of these ranges are described in [\[RFC6335\]](#). According to Section 8.1.2 of [\[RFC6335\]](#), System Ports are assigned by the "IETF Review" or "IESG Approval" procedures described in [\[RFC8126\]](#). User Ports are assigned by IANA using the "IETF Review" process, the "IESG Approval" process, or the "Expert Review" process, as per [\[RFC6335\]](#). Dynamic Ports are not assigned.

The registration procedures for service names and port numbers are described in [\[RFC6335\]](#).

Assigned ports both System and User ports SHOULD NOT be used without or prior to IANA registration.

```
*****
* PLEASE NOTE THE FOLLOWING:                               *
*                                                            *
* ASSIGNMENT OF A PORT NUMBER DOES NOT IN ANY WAY IMPLY AN *
* ENDORSEMENT OF AN APPLICATION OR PRODUCT, AND THE FACT THAT NETWORK *
* TRAFFIC IS FLOWING TO OR FROM A REGISTERED PORT DOES NOT MEAN THAT *
* IT IS "GOOD" TRAFFIC, NOR THAT IT NECESSARILY CORRESPONDS TO THE *
* ASSIGNED SERVICE. FIREWALL AND SYSTEM ADMINISTRATORS SHOULD *
* CHOOSE HOW TO CONFIGURE THEIR SYSTEMS BASED ON THEIR KNOWLEDGE OF *
* THE TRAFFIC IN QUESTION, NOT WHETHER THERE IS A PORT NUMBER *
* REGISTERED OR NOT.                                         *
*****
```

# Port address numbers

Well-known Ports

0 - 1023

Registered Ports

1024 - 49151

Dynamic Ports

49152 - 65565

# Common port numbers

| Port number | Service                                              | Transport protocol |
|-------------|------------------------------------------------------|--------------------|
| 20, 21      | File Transfer Protocol (FTP)                         | TCP                |
| 23          | Telnet                                               | TCP                |
| 25          | SMTP                                                 | TCP                |
| 53          | DNS                                                  | UDP/TCP            |
| 67, 68      | DHCP                                                 | UDP                |
| 69          | TFTP                                                 | UDP                |
| 80          | HyperText Transfer Protocol (HTTP)                   | TCP                |
| 110         | POP3                                                 | TCP                |
| 123         | Network Time Protocol (NTP)                          | UDP                |
| 143         | IMAP                                                 | TCP                |
| 443         | HTTPS (Secure Socket Layer/Transport Layer Security) | TCP                |
| 445         | SMB                                                  | TCP                |
| 514         | Syslog                                               | UDP                |
| 993         | IMAPS                                                | TCP                |
| 995         | POP3 SSL                                             | TCP                |
| 1433        | SQL Server                                           | TCP                |
| 1521        | SQLNET                                               | TCP                |
| 2095        | Webmail                                              | TCP                |
| 3306        | MySQL                                                | TCP                |
| 3389        | RDP                                                  | TCP                |
| 5060, 5061  | SIP                                                  | UDP/TCP            |

# Fun Port numbers to know

## Minecraft

- Java Edition is Port 25565 (TCP/UDP)
- Bedrock Edition Port 19132 UDP and Port 30033 TCP

## Call of Duty

PC, Xbox Port 3074  
Playstation Port 3478  
Xbox Port 88

Fortnite (PC)

**Ports:** 80 (TCP/UDP), 433 (TCP/UDP), 443 (TCP), 3478 (TCP/UDP), 3479 (TCP/UDP), 5060 (TCP/UDP), 5062 (TCP/UDP), 5222 (TCP), 6250 (TCP/UDP), and 12000-65000 (TCP/UDP).

**Action:** You need to unblock these ports in your firewall for both the [Epic Games Launcher](#) and Fortnite to function properly.

For PlayStation Consoles

**PS4:** Requires ports 433 (TCP), 1935 (TCP), 3478-3480 (TCP/UDP), and 5222 (TCP).

**PS5:** Requires ports 433 (TCP), 1935 (TCP), 3478-3480 (TCP), and 5222 (TCP).

For Xbox Consoles

**Xbox One:** Requires ports 433 (TCP), 3074 (TCP), and 5222 (TCP).

**Xbox Series X/S:** Requires ports 433 (TCP), 3074 (TCP), and 5222 (TCP).

# Wireshark Demo with Port numbers

## 4.2 MAC address

### Windows (command)

1. Open **Command Prompt**.
2. Run: `ipconfig /all`
3. Find your adapter and read **Physical Address**.

### macOS (Terminal)

1. Open **Terminal**.
2. Run (Wi-Fi): `ifconfig en0 | grep ether` or (Ethernet): `ifconfig en1 | grep ether`
3. The ether value is the MAC.

### Chromebook (Crosh)

- Press **Ctrl+Alt+T** to open crosh.
- Type `ifconfig` and press Enter.
- Read the ether line for the interface's MAC.

### Linux (terminal)

1. Open a terminal.
2. Run either: `ip link show` or `ifconfig -a`
3. Find your interface; the MAC is listed as link/ether (ip) or ether (ifconfig).

## 4.2 MAC (Media Access Control Address)

- Unique 48-bit identifier burned into a network interface controller (NIC).
- Assigned by the manufacturer, ensuring each device has a unique address.

a2:ba:78:e2:e2:b4

### Organizationally Unique Identifier (OUI)

- First 24 bits (first 6 digits).
- Identifies the manufacturer and device model.
- OUIs are purchased from IEEE (creators of the 802 networking standards).

### Device ID (Vendor Assigned Identifier)

- Last 24 bits (last 6 digits).
- Assigned by the manufacturer, like a serial number.
- Ensures each specific NIC has a unique MAC address.

Two terms are associated with frames entering or leaving an interface:

- **Ingress** – entering the interface
- **Egress** – exiting the interface

A switch forwards based on the ingress interface and the destination MAC address.

A switch uses its MAC address table to make forwarding decisions.

**Note:** A switch will never allow traffic to be forwarded out the interface it received the traffic.

## 4.3 IPv4 Address

# IPv4 Address

Unique 32-bit numeric address divided into four 8-bit octets.

A bit is a 1 or a 0

# Number System

|-------|-------|-------|-------|-------|-------|-------|-------|
| 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |

Lets convert a binary number to Decimal

10111011

# Converting Decimal numbers to Binary

| $2^7$ | $2^6$ | $2^5$ | $2^4$ | $2^3$ | $2^2$ | $2^1$ | $2^0$ |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |

10111011

# Converting Decimal numbers to Binary

| $2^7$ | $2^6$ | $2^5$ | $2^4$ | $2^3$ | $2^2$ | $2^1$ | $2^0$ |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |
| 1     | 0     | 1     | 1     | 1     | 0     | 1     | 1     |

# Converting Decimal numbers to Binary

| $2^7$ | $2^6$ | $2^5$ | $2^4$ | $2^3$ | $2^2$ | $2^1$ | $2^0$ |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |
| 1     | 0     | 1     | 1     | 1     | 0     | 1     | 1     |

# Converting Decimal numbers to Binary

| $2^7$ | $2^6$ | $2^5$ | $2^4$ | $2^3$ | $2^2$ | $2^1$ | $2^0$ |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |
| 1     | 0     | 1     | 1     | 1     | 0     | 1     | 1     |

The first bit is on so we need to add 128

# Converting Decimal numbers to Binary

| $2^7$ | $2^6$ | $2^5$ | $2^4$ | $2^3$ | $2^2$ | $2^1$ | $2^0$ |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |
| 1     | 0     | 1     | 1     | 1     | 0     | 1     | 1     |

128

Second bit is off so we don't need add anything

# Converting Decimal numbers to Binary

| $2^7$ | $2^6$ | $2^5$ | $2^4$ | $2^3$ | $2^2$ | $2^1$ | $2^0$ |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |
| 1     | 0     | 1     | 1     | 1     | 0     | 1     | 1     |

128

# Converting Decimal numbers to Binary

| $2^7$ | $2^6$ | $2^5$ | $2^4$ | $2^3$ | $2^2$ | $2^1$ | $2^0$ |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 128   | 64    | 32    | 16    | 8     | 4     | 2     | 1     |
| 1     | 0     | 1     | 1     | 1     | 0     | 1     | 1     |

## 4.3.4 Parts of a subnet mask

1. **Find the IP address, Subnet mask, and Default gateway of the PC you are using. ipconfig**
2. **Convert all the numbers from Decimal to Binary (be carefull and line the numbers up**

IPv4 Address..... : 10.3.68.11

Subnet Mask..... : 255.255.254.0

Default Gateway : 10.3.68.250

## 4.3.4 Parts of a subnet mask

1. Find the IP address, Subnet mask, and Default gateway of the PC you are using. `ipconfig`
2. Convert all the numbers from Decimal to Binary (be careful and line the numbers up

|                     |               |                                     |
|---------------------|---------------|-------------------------------------|
| IPv4 Address..... : | 10.3.68.11    | 00001010.00000011.01000100.00001011 |
| Subnet Mask..... :  | 255.255.254.0 | 11111111.11111111.11111110.00000000 |
| Default Gateway :   | 10.3.68.250   | 00001010.00000011.01000100.11111010 |

## 4.3.4 Parts of a subnet mask

1. Find the IP address, Subnet mask, and Default gateway of the PC you are using. `ipconfig`
2. Convert all the numbers from Decimal to Binary (be careful and line the numbers up

|                                  | Network Portion            | Host Portion |
|----------------------------------|----------------------------|--------------|
| IPv4 Address..... : 10.3.68.11   | 00001010.00000011.01000100 | 00001011     |
| Subnet Mask..... : 255.255.254.0 | 11111111.11111111.11111110 | 00000000     |
| Default Gateway : 10.3.68.250    | 00001010.00000011.01000100 | 11111010     |

## 4.3.6 Legacy Classful Addressing

RFC 790 (1981) allocated IPv4 addresses in classes

- Class A (0.0.0.0/8 to 127.0.0.0/8)
  - Class B (128.0.0.0 /16 – 191.255.0.0 /16)
  - Class C (192.0.0.0 /24 – 223.255.255.0 /24)
  - Class D (224.0.0.0 to 239.0.0.0)
  - Class E (240.0.0.0 – 255.0.0.0)
- 
- Classful addressing wasted many IPv4 addresses.

Classful address allocation was replaced with classless addressing which ignores the rules of classes (A, B, C).

## 4.3.2 Public and Private IPv4 Addresses

- As defined in in RFC 1918, public IPv4 addresses are globally routed between internet service provider (ISP) routers.
- Private addresses are common blocks of addresses used by most organizations to assign IPv4 addresses to internal hosts.
- Private IPv4 addresses are not unique and can be used internally within any network.
- However, private addresses are not globally routable.

| Network Address and Prefix | RFC 1918 Private Address Range |
|----------------------------|--------------------------------|
| 10.0.0.0/8                 | 10.0.0.0 - 10.255.255.255      |
| 172.16.0.0/12              | 172.16.0.0 - 172.31.255.255    |
| 192.168.0.0/16             | 192.168.0.0 - 192.168.255.255  |

# Network Address Translation (NAT)

- Find your Private IP address (ipconfig, ifconfig)
- Go to **renegar.lol/ipaddress** show your public ip address

## 4.4 IPv6 Address

# IPv6 Addressing Formats

- IPv6 addresses are 128 bits in length and written in hexadecimal.
- IPv6 addresses are not case-sensitive and can be written in either lowercase or uppercase.
- The preferred format for writing an IPv6 address is x:x:x:x:x:x:x:x, with each “x” consisting of four hexadecimal values.
- In IPv6, a hextet is the unofficial term used to refer to a segment of 16 bits, or four hexadecimal values.
- Examples of IPv6 addresses in the preferred format:  
2001:0db8:0000:1111:0000:0000:0000:0200  
2001:0db8:0000:00a3:abcd:0000:0000:1234

# IPv6 Address Representation

## Rule 1 – Omit Leading Zero

- The first rule to help reduce the notation of IPv6 addresses is to omit any leading 0s (zeros).

- **Examples:**

- 01ab can be represented as 1ab
- 09f0 can be represented as 9f0
- 0a00 can be represented as a00
- 00ab can be represented as ab

- **Note:** This rule only applies to leading 0s, NOT to trailing 0s, otherwise the address would be ambiguous.

| Type             | Format                                                |
|------------------|-------------------------------------------------------|
| Preferred        | 2001 : 0db8 : 0000 : 1111 : 0000 : 0000 : 0000 : 0200 |
| No leading zeros | 2001 : db8 : 0 : 1111 : 0 : 0 : 0 : 200               |

# IPv6 Address Representation

## Rule 2 – Double Colon

- A double colon (::) can replace any single, contiguous string of one or more 16-bit hexets consisting of all zeros.

- **Example:**

- 2001:db8:cafe:1:0:0:0:1 (leading 0s omitted) could be represented as 2001:db8:cafe:1::1

- **Note:** The double colon (::) can only be used once within an address, otherwise there would be more than one possible resulting address.

| Type       | Format                                                |
|------------|-------------------------------------------------------|
| Preferred  | 2001 : 0db8 : 0000 : 1111 : 0000 : 0000 : 0000 : 0200 |
| Compressed | 2001:db8:0:1111::200                                  |

## 4.4 IPv6 format

- The **network component** is an IPv6 address's first 64 bits. A network component is used for routing and consists of two parts:
  - The **prefix length**, also named **prefix**, is the first 48 bits of the network component. A prefix describes the public topology.
  - The **subnet ID** is the last 16 bits of the network component. A subnet ID describes the private topology. The private topology is also called the site topology.

| <i>network component</i> |   |           |   | <i>subnet ID</i> |   |           |   |      |
|--------------------------|---|-----------|---|------------------|---|-----------|---|------|
| 2001:0db8:0000:1111      | : | 0000:0000 | : | 0000:0000        | : | 0000:0200 | : | / 64 |
| 2001:0db8:0000:00a3      | : | abcd:0000 | : | 0000:0000        | : | 1234      | : | / 64 |

Table 4.4.1: IPv4 and IPv6 differences.

| Feature                    | IPv4    | IPv6                   |
|----------------------------|---------|------------------------|
| Subnet mask                | Yes     | No, uses prefix length |
| Uses classful addressing   | Yes     | No                     |
| Supports unicast address   | Yes     | Yes                    |
| Supports multicast address | Yes     | Yes                    |
| Supports anycast address   | No      | Yes                    |
| Supports broadcast address | Yes     | No                     |
| Address length size        | 32 bits | 128 bits               |

# Chapter 4: Address Types

# Chapter 5: Segmentation

## 5.1 Network Segmentation

**Process of dividing a single network into a physical or logical network subset**

# 5.1 Network Segmentation

## ***Physical segmentation***

- Segments a network with a networking device or hardware.
- Deployment of multiple switches or a firewall.

# 5.1 Network Segmentation

## *Logical segmentation*

- segments a network with a configuration.
- Deploying multiple subnet masks.

## 5.2 Binary Decimal Conversion

## 5.2 Decimal Conversion

1. Find the IP address, Subnet mask of the PC you are using. `ipconfig`
2. Convert all the numbers from Decimal to Binary (be careful and line the numbers up)

|              |               |                                     |
|--------------|---------------|-------------------------------------|
| IP Address:  | 10.3.68.50    | 00001010.00000011.01000100.00110010 |
| Subnet Mask: | 255.255.254.0 | 11111111.11111111.11111110.00000000 |

1 and 0 = 0

1 and 1 = 1

0 and 1 = 0

## 5.2 Decimal Conversion

1. Find the IP address, Subnet mask of the PC you are using. `ipconfig`
2. Convert all the numbers from Decimal to Binary (be careful and line the numbers up)

IP Address: 10.3.68.50  
Subnet Mask: 255.255.254.0

00001010.00000011.01000100.00110010

## 5.3 Network Address

- IPv4 address **AND** subnet mask = network address (network ID).
- Defines the host range and network segment.
- Network address = first address in a subnet.
- Subnets = smaller logical partitions of a network.

## 5.3 Network Address and Range

|                     |               |                                     |
|---------------------|---------------|-------------------------------------|
| Subnet Mask:        | 255.255.254.0 | 11111111.11111111.11111110.00000000 |
| Network Address:    | 10.3.68.0     | 00001010.00000011.01000100.00000000 |
| First host Address: | 10.3.68.1     | 00001010.00000011.01000100.00000001 |
| Last host Address:  | 10.3.69.254   | 00001010.00000011.01000101.11111110 |
| Broadcast Address:  | 10.3.69.255   | 00001010.00000011.01000101.11111111 |

Network Address:  
10.3.68.0

Network Range:  
10.3.68.1      10.3.69.254

Broadcast Address:  
10.3.69.255

# Network & Gateway Addresses

- Devices on different subnets can't talk directly.
- **Router** connects subnets.
- Router's local IP = **gateway (default gateway)** for subnet devices.
- Packet handling:
  - Same subnet → send locally.
  - Different subnet → send to gateway.

## 5.4 Classless addresses

# Classless Addressing (CIDR)

- **Classless Addressing (CIDR)**
- Uses **Variable Length Subnet Mask (VLSM)**.
- Created to reduce IPv4 address shortage.
- Unlike classful (A, B, C), CIDR can allocate on any bit boundary

# CIDR Notation

- IP address + “/” + number of network bits.
- Ex: 172.16.10.12/16.
- **Network segment** → routing between networks.
- **Host segment** → address allocation within subnet.

| CIDER | Total # of Address | # OF Hosts | Netmask         |
|-------|--------------------|------------|-----------------|
| /30   | 4                  | 2          | 255.255.255.252 |
| /29   | 8                  | 6          | 255.255.255.248 |
| /28   | 16                 | 14         | 255.255.255.240 |
| /27   | 32                 | 30         | 255.255.255.224 |
| /26   | 64                 | 62         | 255.255.255.192 |
| /25   | 128                | 126        | 255.255.255.128 |
| /24   | 256                | 254        | 255.255.255.0   |
| /23   | 512                | 510        | 255.255.254.0   |
| /22   | 1024               | 1022       | 255.255.252.0   |
| /21   | 2048               | 2046       | 255.255.248.0   |
| /20   | 4096               | 4094       | 255.255.240.0   |
| /19   | 8192               | 8190       | 255.255.224.0   |
| /18   | 16384              | 16382      | 255.255.192.0   |
| /17   | 32768              | 32766      | 255.255.128.0   |
| /16   | 65536              | 65534      | 255.255.0.0     |

# 5.5 Subnetting Basics

# Chapter 5: Segmentation

# Chapter 6: Protocols

# Protocol types

- IP
- TCP
- UDP
- TCP/IP

## 6.1 Protocol types

# 6.1 Protocol types

## Protocol numbers

- Network layer (Layer 3, IP).
- Example: TCP = protocol number 6; UDP = protocol number 17.

## Port numbers

- Used within UDP/TCP headers to represent application protocols/services.
- Example: HTTP = TCP port 80; DHCP = UDP ports 67 and 68.

## IPv6

- Current internet protocol version.
- Provides addressing for routers to deliver packets to destination devices.

# 6.1 Protocol types

## TCP (Transmission Control Protocol)

- Connection-oriented protocol.
- Ensures reliable transmission of data between devices.

## UDP (User Datagram Protocol)

- Connectionless protocol.
- Transmits data between devices without reliability overhead.

# 6.1 Protocol types

---

- **TCP/IP (Transmission Control Protocol/Internet Protocol)**
  - Core communication protocol suite for internet/intranet.
  - TCP: creates reliable connections, assembles messages into packets, reassembles at destination, verifies receipt.
  - IP: defines addressing and routing for packets.
  - Gateways use IP addressing to route data correctly.

# Transportation of Data

## The Right Transport Layer Protocol for the Right Application

---

- UDP is also used by request-and-reply applications where the data is minimal, and retransmission can be done quickly.
- If it is important that all the data arrives and that it can be processed in its proper sequence, TCP is used as the transport protocol.

### UDP

VoIP  
(IP telephony)

DNS  
(Domain Name Resolution)

#### Required protocol properties:

- Fast
- Low overhead
- Does not require acknowledgements
- Does not resend lost data
- Delivers data as it arrives

### TCP

SMTP/IMAP  
(Email)

HTTP/HTTPS  
(World Wide Web)

#### Required protocol properties:

- Reliable
- Acknowledges data
- Resends lost data
- Delivers data in sequenced order

# TCP Overview

## TCP Header

---

- TCP is a stateful protocol which means it keeps track of the state of the communication session.
- TCP records which information it has sent, and which information has been acknowledged.

## TCP Overview

### Applications that use TCP

TCP handles all tasks associated with dividing the data stream into segments, providing reliability, controlling data flow, and reordering segments.

# UDP Overview

## UDP Header

---

- The UDP header is far simpler than the TCP header because it only has four fields and requires 8 bytes (i.e. 64 bits).

# UDP Overview

## Applications that use UDP

---

- Live video and multimedia applications - These applications can tolerate some data loss but require little or no delay. Examples include VoIP and live streaming video.
- Simple request and reply applications - Applications with simple transactions where a host sends a request and may or may not receive a reply. Examples include DNS and DHCP.
- Applications that handle reliability themselves - Unidirectional communications where flow control, error detection, acknowledgments, and error recovery is not required, or can be handled by the application. Examples include SNMP and TFTP.

# Wireshark Demo!!!!

# TCP Communication Process

## TCP Connection Establishment

Step 1: The initiating client requests a client-to-server communication session with the server.

Step 2: The server acknowledges the client-to-server communication session and requests a server-to-client communication session.

Step 3: The initiating client acknowledges the server-to-client communication session.

# TCP Communication Process

## TCP Three-Way Handshake Analysis (Cont.)

The six control bit flags are as follows:

- **URG** - Urgent pointer field significant
- **ACK** - Acknowledgment flag used in connection establishment and session termination
- **PSH** - Push function
- **RST** - Reset the connection when an error or timeout occurs
- **SYN** - Synchronize sequence numbers used in connection establishment
- **FIN** - No more data from sender and used in session termination

# TCP Communication Process

## Session Termination

- Step 1: When the client has no more data to send in the stream, it sends a segment with the FIN flag set.
- Step 2: The server sends an ACK to acknowledge the receipt of the FIN to terminate the session from client to server.
- Step 3: The server sends a FIN to the client to terminate the server-to-client session.
- Step 4: The client responds with an ACK to acknowledge the FIN from the server.

# Reliability and Flow Control

## TCP Reliability – Data Loss and Retransmission

No matter how well designed a network is, data loss occasionally occurs.

TCP provides methods of managing these segment losses. Among these is a mechanism to retransmit segments for unacknowledged data.

# TCP Reliability – Data Loss and Retransmission (Cont.)

Host operating systems today typically employ an optional TCP feature called selective acknowledgment (SACK), negotiated during the three-way handshake.

If both hosts support SACK, the receiver can explicitly acknowledge which segments (bytes) were received including any discontinuous segments.

# Directory Service (DS)

---

Software system that organizes, manages, administers, and locates network resources/objects.

Identifies every network resource (users, computers, printers, servers, email addresses, etc.).

**Netware directory services (NDS)** - Novell Netware uses NDS. NDS maintains information about all network resources (users, groups, servers, and volumes) in a hierarchical tree structure.

**Active directory services (ADS)** - Microsoft uses ADS. ADS was developed after NDS and is Microsoft's version of NDS.

# LDAP

---

## LDAP (Lightweight Directory Access Protocol)

- Accesses and maintains distributed directory information services over an IP network.
- Provides a central location for storing **usernames and passwords**.
- Applications and services use LDAP to **validate users**.
- Example: Active Directory in Windows Server 2019 uses LDAP.
- Uses **TCP or UDP port 389**.

## Security of LDAP

- LDAP traffic is **not secure** (transmitted in cleartext).

## LDAPS (LDAP Secure / LDAP over SSL)

- Uses **SSL/TLS** to secure LDAP transmissions.
- Client and server establish SSL/TLS connection **before transmitting LDAP messages**.
- LDAPS connection ends when the underlying SSL/TLS connection closes.
- Uses **TCP port 636** by default.

# Routing Protocols

WE have a packet now what!!!!

## Routing Basics

## 6.2 Distance vector protocol

- A ***distance vector protocol*** is a routing protocol that uses distance vectors or hop count as a primary metric to determine a packet's destination route.
- **Characteristics of a distance vector protocol:**
  - Routinely sends routing table information to neighboring routers.
  - Determines the best path using hop count. Hop count is the number of routers the data passes through to get to the destination device.
  - Uses the Bellman-Ford algorithm to calculate the best route.

# *Routing Information Protocol (RIP)*

ers

# IGRP

## Cisco

***Interior Gateway Routing Protocol (IGRP)*** is a proprietary distance vector routing protocol used to send routing information within an autonomous system. To avoid routing loops, IGRP updates the occurring network changes and uses error management. IGRP is a network layer protocol (Layer 3). IGRP uses IP protocol 9 directly.

- IGRP characteristics:
  - Routers send updates to neighboring routers every 90 seconds.
  - The maximum hop count is 255.
  - Metric parameters:
    - Delay
    - Bandwidth
    - Reliability
    - Load

## 6.3 Link state (OSPF) Open Shortest Path First

- A **link state protocol**, also known as **shortest path first protocol**, is an IGP routing protocol used in packet switching networks. A link state routing protocol has a full network topology picture by using three tables per enabled router. Using the topology and neighbor connectivity information, each router calculates the best path to each network destination. Each calculated best path forms the router's routing table.
- **Link-state protocol characteristics:**
  - Floods information to each router about the state of routers directly connected links.
  - Uses link state information to build a link-state database, providing a full network topology picture.
  - Uses bandwidth efficiently.
  - Intensive use of CPU and memory.

## 6.3 BGP

***Border Gateway Protocol (BGP)*** is an exterior gateway protocol enabling the internet to exchange routing information between autonomous systems. The internet has thousands of smaller autonomous systems connected together. BGP is the protocol for routing the data path through multiple autonomous systems. BGP is an application layer protocol (Layer 7). BGP uses TCP port 179.

***USED BY ISP (internet Service Providers) and WAN ports on enterprise routers.***

## 6.3 *Enhanced Interior Gateway Routing Protocol (EIGRP)*

- EIGRP advantages over IGRP:
  - Provides faster convergence.
  - Exchanges router information more efficiently.
  - Addresses scalability problem.
  - Improves voice and video quality.
  - Updates neighboring routers with changes only, not an entire routing table.
  - Uses a Hello packet to notify neighboring routers the router is operative. If no Hello packet is sent after a certain time, the router is considered offline.

# CDP and LLDP

- ***Cisco Discovery Protocol (CDP)***
- ***Link Layer Discovery Protocol (LLDP)***

***Layer 2*** discovery protocols used to learn and share information about neighboring devices. Ex: Switches and firewalls. CDP is a Cisco-proprietary protocol whereas LLDP is a non-proprietary or standards-based protocol. CDP and LLDP are compatible. However, exclusively Cisco-based networks typically use CDP instead of LLDP.

## 6.4 Common protocols

# ***Network Management Protocol (NMP)***

Internet Control Message Protocol (ICMP)

Simple network management protocol (SNMP).

Suite of protocols defining processes, procedures, and policies to manage a network.

# Server **Message Block (SMB) Protocol**

a client-server communication protocol, is used for sharing access to files, printers, and serial ports. SMB can also carry transaction protocols for interprocess communication and is implemented in Microsoft Windows.

# *Simple network management protocol (SNMP)*

## SNMP

- Network protocol for monitoring and managing networked devices in an IP network.
- Operates at the **application layer (Layer 7)**.
- Uses **TCP ports 161 and 162**.

## Key Components

- **Managed Device / Network Element:**
  - Any device with an SNMP interface (switch, router, modem, printer, IP phone, host, etc.).
- **SNMP Manager:**
  - System that monitors and controls network elements.
- **SNMP Agent:**
  - Software running on the device that collects and maintains device information.

## 6.5 Secure protocols

*Secure Sockets Layer (SSL)*

*Transport Layer Security (TLS)*

cryptography protocols used to provide secure communication between devices over a network.

## 6.5 Certificates

Security certificate (often called **SSL certificate**) issued by a Certificate Authority (CA).

Authenticates a website and provides a secure connection.

## 6.6.3: HTTPS SSL/TLS handshake.

1. Web browser (HTTPS client) requests an HTTPS session from a web server.
2. Web server sends its digital certificate
3. Session key (symmetric key) and encrypts the session key with the web server's public key obtained from the digital certificate.
4. Server decrypts the session key with the web server's private key, encrypts "Finish" with the session key, and sends the encrypted message to the web browser.
5. Web browser encrypts "Finish" with the session key and sends the encrypted message to the web server. The HTTPS session data is encrypted with the session key.

# ***Secure shell (SSH)***

## **SSH (Secure Shell)**

- Cryptographic network protocol for secure operation over an unsecured network.
- Uses **client-server model** (SSH client connects to SSH server).
- Replacement for **Telnet** and other insecure remote shell protocols.
- Uses **TCP port 22** by default.

## 6.6 Mail, web and remote access protocol

- **Simple Mail Transfer Protocol (SMTP)** is a network protocol for sending, receiving, and relaying outgoing emails. SMTP is an application layer protocol (Layer 7). SMTP uses TCP port 25 and SMTPS uses port 587.
- **Hyper text transfer protocol (HTTP)** is a network protocol for distributing graphics, audio, video, text, and hyperlinks on networks. HTTP is an application layer protocol (Layer 7). HTTP uses TCP port 80.
- **Hypertext transfer protocol secure (HTTPS)**, also known as **HTTP over SSL** or **HTTP over TLS**, is an extension of the hypertext transfer protocol (HTTP) that uses SSL/TLS to establish an authenticated and encrypted connection between a client and a server. HTTPS is used for secure data exchange between a web browser and a web server. HTTPS is an application layer protocol (Layer 7). HTTPS uses TCP port 443 by default.

# *File transfer protocol (FTP)*

## FTP (File Transfer Protocol)

Network protocol for transferring files between devices.

Operates at the **Application Layer (Layer 7)**.

Uses **TCP ports 20 (data) and 21 (command)**.

## Client/Server Model

Uses **two channels**: command channel and data channel.

Transfers files between two devices.

## Common FTP Uses

**Backup** – move data at regular intervals for safekeeping.

**Replication** – duplicate data in real time for availability/resilience.

**Data Loading** – transfer/load data to a remote device (often cloud-based).

## TFTP (Trivial File Transfer Protocol)

Simplified version of FTP.

Primarily used for transferring **network device configurations**.

Uses **UDP port 69**.

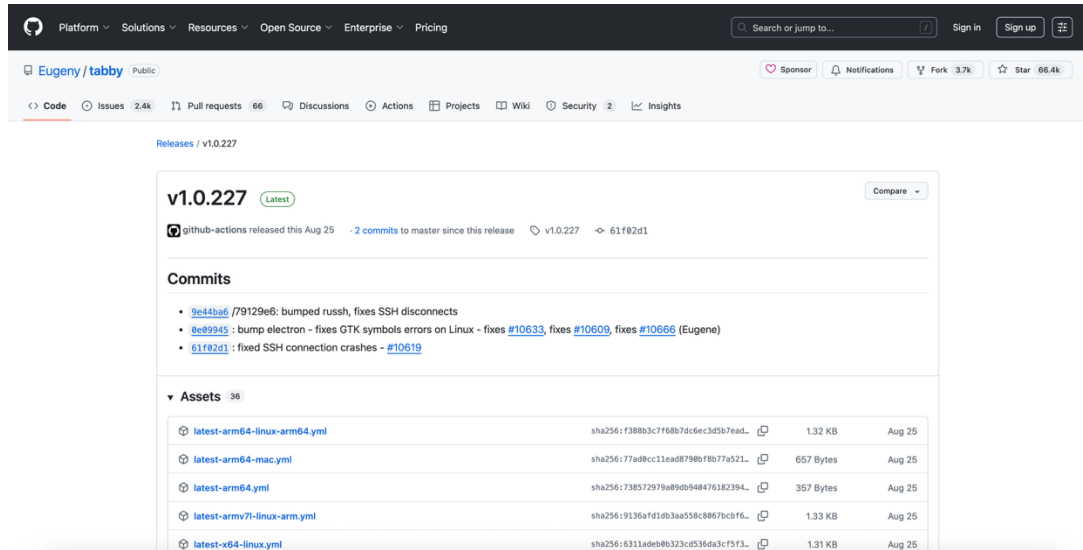

Commonly used in **PXE boot** to download network software.

## Table 6.6.1: File transfer protocols.

| Protocol    | Security mechanism | Port                                                |
|-------------|--------------------|-----------------------------------------------------|
| <b>FTP</b>  | None               | TCP 20 (data channel)<br>TCP 21 (control channel)   |
| <b>FTPS</b> | FTP over SSL/TLS   | TCP 989 (data channel)<br>TCP 990 (control channel) |
| <b>SFTP</b> | SSH                | TCP 22                                              |

## Create a Free UNIX Shell Account

Your E-Mail:

Preferred Login:

Confirm

### Alternative methods

- **MacOS X** users, click here: <ssh://new@sdf.org>
- **Web Browser** users may use our HTML5 SSH client: <https://ssh.sdf.org>
- **Linux/UNIX** users can type 'ssh new@sdf.org' at their shell prompts.

For Microsoft Windows we highly recommend the free SSH client [putty.exe](#).

If you have any questions or cannot figure out how to use **SSH**, live help is available on IRC via [irc.sdf.org](#) in the **#helpdesk** channel.

# Chapter 6: Protocols

# Chapter 7: Switches and Routers

## 7. Switches and Routers

## 7.1 Network transmission

# Broadcast, multicast, and unicast

A **cast** is the transmission of packets across network media.

Three cast types:

- Unicast - **Unicast** is a cast to a single network device.
- Multicast - **Multicast** is a cast to a group of network devices simultaneously.
- Broadcast - **Broadcast** is a cast to all devices on the network simultaneously.

# Unicast (One to one)

# Multicast (One to many)

# Broadcast (One to everyone)

# Broadcast and collision domains

## Broadcast domain:

- Logical Layer 2 network segment where all devices receive broadcast traffic.
- By default, all switch ports share one broadcast domain.
- Each router port forms a separate broadcast domain.

## Collision domain:

- Area where packet/frame collisions can occur at Layer 2.
- Collisions happen when two devices transmit simultaneously.
- Each switch, bridge, or router port is its own collision domain.
- All **hub ports** share a **single collision domain**.

# Broadcast domains

# Collision domain

# Maximum Transmission Unit (MTU):

- Largest Layer 3 protocol data unit (PDU) that can be transmitted.
- Smaller MTU → lower delay; larger MTU → less overhead.
- Measured in bytes; Ethernet MTU = **1,500 bytes**.

## Overhead:

- MTU = maximum frame size – overhead.
- Ethernet frame = **1,518 bytes total**, with **18 bytes** of overhead.

## Jumbo Frame:

- Ethernet frame with payload > 1,500 bytes.
  - Used on **1 Gbps LANs**.
  - Maximum size = **9,000 bytes**.
- 

# Maximum Transmission Unit (MTU):

# Carrier Sense Multiple Access (CSMA):

MAC protocol designed to **reduce network collisions**.

Collisions slow performance due to retransmissions.

Device **listens for a carrier signal** before transmitting.

If another transmission is detected, it **waits until the channel is clear**.

# Two types of **Carrier Sense Multiple Access (CSMA)**:

## **CSMA/CD (Collision Detection):**

- Used on **wired networks** (e.g., Ethernet).
- Detects collisions and sends a **jam signal** to stop transmissions.

## **CSMA/CA (Collision Avoidance):**

- Used on **wireless networks**.
- Avoids collisions using **RTS (Request to Send)** and **CTS (Clear to Send)** signals before sending data.

---

## 7.2 Network traffic

# Traffic shaping

- Bandwidth management technique that **controls and prioritizes traffic flow**.
- Ensures **high-priority traffic** moves before lower-priority traffic.

- **Quality of Service (QoS):**  
Layer 3; prioritizes traffic for resource-intensive applications.
- **Class of Service (CoS):**  
Layer 2; prioritizes traffic by group (e.g., **VoIP > HTTP**).

# VPN (Virtual Private Network):

- A tunneling protocol that encrypts data for secure transmission.
  - Commonly used due to its **ease of use and security benefits.**
- 
- **Full Tunnel:**
    - **All traffic** is routed and encrypted through the VPN.
    - **Most secure** option—protects all network communication.
    - Recommended for handling **confidential data.**
  - **Split Tunnel:**
    - Only **non-internet traffic** goes through the VPN.
    - **Internet traffic** (e.g., Google, Yahoo) bypasses the VPN.
    - Useful for accessing **local and remote resources simultaneously**, but **less secure.**

# VPN Demo

A dramatic landscape photograph featuring a massive, dark, and swirling cloud formation that dominates the upper half of the frame. The sky is a deep, dark blue, and a faint rainbow is visible on the right side. The foreground consists of a field of tall, golden-brown grasses. The overall mood is intense and atmospheric.

# Network Loop (Layer 2 / Bridge Loop):

Occurs when  
**multiple paths**  
exist between two  
network endpoints.

Happens at the  
**data link layer**  
(**Layer 2**).

Example: Two hosts  
connected by more  
than one switch  
path.

# Spanning-Tree Protocol

Spanning Tree Protocol (STP) is a **loop-prevention** network protocol that allows for redundancy while creating a loop-free Layer 2 topology.

STP **logically** blocks physical loops in a Layer 2 network, preventing frames from circling the network forever.

# Spanning-Tree Protocol

## Bridge Protocol Data Unit (BPDU):

Packets exchanged between switches to **detect network loops**.

Used by **Spanning Tree Protocol (STP)** to build a **loop-free topology**.

**Only switches** should send BPDUs; **end devices** should not.

## Security Risk:

Attackers can inject **malicious BPDUs** to alter the STP topology.

This manipulation can **redirect or disrupt Layer 2 traffic**.

## BPDU Guard:

**Prevents BPDUs** from entering switch ports connected to end devices.

**Protects STP topology** from BPDU-based attacks.

# Spanning- Tree Operations

Using the Spanning Tree Algorithm (STA), Spanning tree process (STP) builds a loop-free topology in a four-step process:

1. Elect the root **bridge**.
2. Elect the root **ports**.
3. Elect **designated** ports.
4. Elect **alternate** (blocked) ports.

Spanning-Tree Demo

## 7.3 Switch features

## Network Switch:

- Acts as a **multiport bridge** using **packet switching**.
- Forwards packets based on **MAC addresses**.
- Ports can be **access, trunk, or hybrid**.
- **Switch Port:**
  - Each port is **individually configurable** to suit connected devices.

# Common Switchport configurations

|        |                                                                                             |
|--------|---------------------------------------------------------------------------------------------|
| Speed  | Speed – Defines data rate (e.g., 100 Mbps, 1 Gbps).                                         |
| Duplex | Duplex – Sets half or full duplex communication.                                            |
| Flow   | Flow Control – Manages congestion and packet loss.                                          |
| Port   | Port Security – Limits access based on MAC addresses.                                       |
| Port   | Port Aggregation – Combines multiple ports for higher bandwidth.                            |
| Port   | Port Mirroring - Switch feature that copies traffic from one or more ports to another port. |

# Tagged and untagged ports

## Tagged Port (Trunk Port):

- Carries traffic from **multiple VLANs**.
- Uses **802.1Q (Dot1Q)** encapsulation to insert a **4-byte VLAN tag** into Ethernet frames.
- Allows VLAN traffic to travel between switches.

## Untagged Port (Access Port):

- Carries traffic from **a single VLAN**.
- Typically connects to **end devices** (e.g., PCs, printers).

## Native VLAN:

- Used to handle **untagged frames** from legacy or non-VLAN-aware devices.
- Should be an **unused VLAN** for security and isolation.

## Tagging traffic

**Ethernet data frame**

**VLAN data frame**

TPID - Indicates if a frame is VLAN-tagged

PRI - Indicates frame priority

CFI - Indicates if MAC address is encapsulated in standard format

VID - Indicates which VLAN the frame belongs to

## 7.4 Switch configuration

Power over Ethernet (PoE)

Tagged ports

VLAN tunneling

Port duplex

Port speed

Auto medium dependent interface (MDI)/medium dependent interface crossover (MDI-X) port feature

# ***Power over Ethernet (PoE)***

## **Power over Ethernet (PoE):**

- Delivers **power and data** over the same Ethernet cable.
- Provided by **PoE-enabled switches** or **add-on modules**.
- Eliminates the need for separate power outlets, offering **flexibility and cost savings**.

## **Common PoE Devices:**

- **Wireless access points** (with antennas)
- **Security cameras**
- **VoIP phones**

# Power over Ethernet Plus (PoE+):

## Power over Ethernet Plus (PoE+):

Enhanced version of PoE with **higher power capacity**.  
Provides up to **30 watts** per port for high-power devices.  
**PoE++** extends power beyond 30 W for devices like **TVs and laptops**.

## Common PoE+ Devices:

**Wireless access points** (four or more antennas)  
**Pan/tilt/zoom security cameras**  
**Video IP phones**  
**Alarm systems**

# Table 7.4.1: IEEE PoE and PoE+ standards.

Table 7.4.1: IEEE PoE and PoE+ standards.

| IEEE standard                      | Maximum power rating | Device power available | Supported cable |
|------------------------------------|----------------------|------------------------|-----------------|
| 802.3af Type 1 - PoE               | 15.4 W               | 12.95 W                | CAT3 and above  |
| 802.3at Type 2 - PoE+              | 30 W                 | 25.5 W                 | CAT5 and above  |
| 802.3bt Type 3 - 4PPoE/PoE++       | 60 W                 | 51 W                   | CAT5 and above  |
| 802.3bt Type 4 - 4PPoE/ PoE++/UPoE | 100 W                | 71 W                   | CAT5 and above  |

## Auto-MDI-X.

*Auto-MDI-X configures the cable connection automatically, eliminating the need for a crossover cable. A straight thru cable connects a MDI to MDI-X port connection, or a MDI-X to MDI-X. A crossover cable is used for a MDI to MDI port connection.*

Switches

Switches

# Link Aggregation Control Protocol (LACP)

- **Link Aggregation:**
  - Combines **multiple physical links** into one for **higher bandwidth** and **redundancy**.
  - Commonly used between **switches, servers, NAS devices, or multi-port access points**.
- **Logical Aggregation Group (LAG):**
  - The **single logical channel** formed by combining multiple physical connections.
- **Link Aggregation Control Protocol (LACP):**
  - Defined by **IEEE 802.3ad**.
  - Provides a **standardized negotiation method** for forming and managing LAGs.
- **LACP Concepts:**
  - **System Priority:** Determines the order devices select active interfaces for aggregation.
  - **Interface Priority:** Assigns values to select which interfaces are active (lower = higher priority).
  - **LACP Mode (M:N):** Specifies **M active** and **N backup links** for **reliability and load balancing**.

# LACP Demo

## 7.5 VLANs

Provides **logical segmentation** of a network independent of physical layout.

Enhances **access control** and **network performance**.

Allows grouping by **department** or **resource needs**.

# Use Case Example:

---

- Multi-floor office with departments spread across floors.
- Physical layout no longer matches departmental organization.
- Accounting users on different floors need access to accounting resources only.

# VLAN Benefits:

**Creates multiple broadcast domains** to reduce traffic.

**Limits broadcast traffic** within and between VLANs.

**Groups users logically** by department, not location.

**Maintains consistent access control** across the network.

# VLAN Demo

# VLAN membership types

## Port-based VLAN (Static VLAN):

- Assigns a VLAN to a **specific switch port**.
- The host connected to that port automatically joins the VLAN.

## MAC-based VLAN:

- Assigns VLAN membership based on the device's **MAC address**.
- Allows VLAN assignment regardless of the physical switch port used.

## Protocol-based VLAN:

- Uses **network protocol types** (e.g., IPv4, IPv6) to assign VLAN membership.
- Enables traffic separation based on **protocol** rather than hardware or port.

Table 7.5.1:  
Membership types.

| Membership type | OSI layer | Description                                             |
|-----------------|-----------|---------------------------------------------------------|
| Port            | Layer 1   | Membership is defined by a switch port VLAN number.     |
| MAC address     | Layer 2   | Membership is defined by MAC address.                   |
| Protocol type   | Layer 3   | Membership is defined by the network IP subnet address. |

# VLAN connection types

## VLAN-aware Device:

Understands VLAN tags and membership information.

## VLAN-unaware Device:

Does **not recognize VLAN tags** or VLAN formats.

## VLAN Connection Types:

**Trunk Line:** Connects only **VLAN-aware devices**; carries traffic for multiple VLANs.

**Access Link:** Connects a **VLAN-unaware device** to a VLAN-aware port; carries one VLAN.

**Hybrid Link:** Combines trunk and access features; supports **both VLAN-aware and VLAN-unaware devices**.

# Spanning Tree Demo

## 7.6 VLAN design and configuration

- **VLAN Advantages:**
  - Improves **network performance** and **administration**.
  - Enhances **resource access control** and segmentation.
- **Requirements and Costs:**
  - **Layer 3 device** (router or Layer 3 switch) needed for inter-VLAN communication.
  - **Additional hardware and configuration** increase deployment cost.
- **Security Considerations:**
  - VLAN devices (e.g., routers) can become **attack targets**.
- **VLAN-specific threats:**
  - **VLAN Hopping:** Attacker moves from one VLAN to another via a breached VLAN.
  - **Switch Spoofing:** Attacker pretends to be a trunking switch to access multiple VLANs.
  - **Double-Tagging:** Attacker inserts **two VLAN tags** to bypass VLAN protections.
- **Key Takeaway:**
  - VLAN deployment improves efficiency but requires **careful security and cost planning**.

# VLAN security

## VLAN Security Purpose:

- Creates **virtual boundaries** to prevent unauthorized access.
- **Segments sensitive devices** and data for better isolation.
- Provides **protocol separation**, limiting traffic to specific VLANs.
- Extends security to **wireless devices**, maintaining consistent policies.

## Key Point:

True VLAN security depends on **following best practices**, not just configuration.

| Best practice                                             | Justification                                                                                      |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| Assign one VLAN per access port                           | An access port should only carry traffic for a single VLAN                                         |
| Exclude all other VLANs from an access port               | Ensures a single VLAN uses an access port                                                          |
| Configure an access port as untagged                      | Mitigates double-tagging                                                                           |
| Exclude unwanted VLANs from a trunk port                  | Unwanted VLANs should not traverse a trunk port                                                    |
| Configure a trunk port as tagged for all VLANs except one | Tagging ensures traffic reaches the correct VLANs - only the native VLAN receives untagged traffic |
| Configure a management VLAN                               | Segregates user traffic from administrative traffic                                                |
| Do not use VLAN 1                                         | VLAN 1 is a preconfigured VLAN an attacker can exploit                                             |
| Assign all ports to at least one VLAN                     | Unused ports can be exploited                                                                      |
| Supplement VLAN routing with an access control list (ACL) | Provides an additional layer of packet filtering, limiting unwanted traffic                        |
| Assign the correct VLAN type to a port                    | Improves both performance and security                                                             |

Table 7.6.1: VLAN security best practices

## VLAN switch configurations

Most VLAN switch configurations require five steps:

1. Enter configuration mode
2. Enter VLAN mode to create a VLAN or range of VLANs
3. Exit VLAN mode
4. Confirm VLAN/VLAN range creation
5. Save the VLAN configuration to the VLAN database

# VLAN Router Configurations (Inter-VLAN Routing):

Enables  
communication  
**between**  
VLANs.

Method depends  
on device type  
and available  
interfaces.

# Inter-VLAN Routing Methods:

**One-Port-Per-VLAN:** Each VLAN connects to a **dedicated physical router port**.

## **Router-on-a-Stick:**

- Uses **one physical port** divided into **multiple subinterfaces**.
- Each subinterface handles a separate VLAN.

## **Layer 3 Switch (SVIs):**

- Uses **Switched Virtual Interfaces (SVIs)** to route traffic between VLANs.

## 7.7 Security zones and IP support

### Types of Security Zones:

- **Trusted Zone (Private Zone):**
  - Contains internal, authorized resources.
  - Resources **trust one another** (e.g., internal servers and clients).
- **Untrusted Zone (Public Zone):**
  - Contains resources **outside organizational control** (e.g., the internet).
  - Trusted zone resources **do not trust** untrusted zone resources.
- **Demilitarized Zone (DMZ / Screened Subnet):**
  - Sits **between trusted and untrusted zones**.
  - Hosts **public-facing resources** (e.g., web, email, DNS servers).
  - Protects the internal network from external threats.

# Demilitarized zone

---

- Sits **between trusted and untrusted zones**.
- Hosts **public-facing resources** (e.g., web, email, DNS servers).
- Protects the internal network from external threats.

# Honeypot

---

- **Decoy system** placed in the DMZ to attract attackers.
- Collects data on attack methods to **strengthen network defenses**.

## How Honeypot Works

# Zero Trust Network Architecture (ZTA):

Also known as **perimeter-less security**.

Based on the principle of “**never trust, always verify.**”

Assumes the network is **always compromised** with **internal and external threats**.

**No automatic trust** is granted to any device or user.

**Access control** is enforced **at every access attempt**, regardless of location or trust level.

# Network Address Translation (NAT):

# NAT Demo

# Types of NAT:

## Port Address Translation (PAT):

- Maps **multiple private devices** to one public IP using **unique port numbers**.
- Hides internal IPs for **added security**.

## Static NAT (One-to-One):

- Permanently maps one private IP to one public IP.
- Entries remain in the **NAT table** until manually removed.

## Dynamic NAT:

- Temporarily maps private IPs to available public IPs.
- **Mappings expire** after a timeout period.

## Source NAT (SNAT):

- Translates **source IPs** (private → public).
- Most common form used for outbound internet access.

# Dual stack

## Why Run Dual Stack:

- Ensures **compatibility** during the transition from IPv4 to IPv6.
- Allows **IPv4 and IPv6 to operate simultaneously** without disruption.
- Supports communication with both **legacy IPv4** and **modern IPv6** networks.

# Dual Stack Technology:

## Dual Stack Technology:

- Enables devices and networks to **send and receive** both IPv4 and IPv6 packets.
- Used by ISPs to provide **seamless connectivity** during the migration period.
- Implemented on **routers, servers, firewalls, and other network equipment**.

## Dual Stack Devices and Networks:

- **Dual-stack device:** Can process both IPv4 and IPv6 traffic at the same time.
- **Dual-stack network:** All devices understand and operate with both protocols concurrently.

## 7.8 Routers

# Router basics

## Router Purpose:

- Connects **two or more networks or subnetworks**.
- **Forwards packets** to their destination IP addresses.
- Allows multiple devices to share a **single internet connection**.
- Commonly connects a **LAN to a WAN**.

# Router basics

## Routing Table:

- Used to determine the **best path** for forwarding data.
- Default route destination: **0.0.0.0** (represents any network).

# Router basics

## Time to Live (TTL) / Hop Limit:

- Defines how long a packet can exist in the network before being discarded.
- **Decreases by 1** each time the packet passes a router.
- If TTL reaches **zero**, the packet is dropped to prevent endless looping.

# Types of routers

## Wireless Router:

- Connects to a **modem via Ethernet cable**.
- Creates a **WLAN (Wireless Local Area Network)** for multiple wireless devices.
- Provides **internet access** without physical cabling to end devices.

## Wired Router:

- Connects to a **modem and network devices using Ethernet cables**.
- Creates a **LAN (Local Area Network)** through wired connections.
- Provides **reliable internet access** to connected devices.

## Router Types and Functions:

- **Core Router:** Operates within the **backbone of a network**, managing high-speed data.
- **Edge Router:** Connects **internal networks to external networks** (e.g., ISPs).
- **Virtual Router:** Software-based; runs routing functions **without dedicated hardware**.

## Table 7.8.1: Router types

| Specialized router type | Characteristic                                                                                             |
|-------------------------|------------------------------------------------------------------------------------------------------------|
| Edge router             | Installed at the boundaries of a network. Distributes packets across multiple networks.                    |
| Core router             | Distributes packets within the same network rather than across multiple networks.                          |
| VPN router              | Is a normal router with VPN client software installed. Every VPN connected device is protected by the VPN. |

# Routing Function:

Builds a **map of the network** using **static or dynamic routing**.

**Static Routing:** Manually configured; does **not adapt** to network changes.

**Dynamic Routing:** Uses **protocols** to automatically share topology updates with other routers.

Both methods populate the **routing table**, which guides packet forwarding.

# Router Advertisement (RA):

Broadcasts a router's **IP address** on the local network.

Helps hosts **discover available routers** automatically.

**Security Risk:** Rogue RAs can redirect traffic to a malicious device.

**RA Guard:** Blocks or rejects **unauthorized RA transmissions** to prevent spoofing attacks.

# Access Control List (ACL): security

- A set of filtering rules used by routers, switches, and firewalls.
- Determines whether network traffic is allowed or denied.
- Evaluates packets based on IP address, protocol, or port number.
- Used to enhance security, control access, and manage traffic flow.

## ACL Types:

**Standard ACL:** Filters traffic based only on the **source IP address**.

**Extended ACL:** Filters traffic using **source and destination IPs, ports, and protocols**.
